

# Levitating Globe

P8-3200

## BACKGROUND:

Your Levitron AG Anti Gravity Globe uses an advanced electromagnetic field levitation system to keep the globe suspended in place. Packaged inside your globe is a set of specific instructions you must follow in order to successfully levitate the globe. Please take care to follow these instructions carefully to assure proper performance. Helpful tips are also included inside the instruction booklet if you experience any difficulties in levitating your globe.

## TROUBLESHOOTING:

If after using these tips you are still unsuccessful, or if the globe stops working after being engaged for a period of time, you may need to reset the globe. The electromagnetic field sensor inside the base is designed to automatically turn off power to the unit under certain conditions in order to prevent damage to the circuitry and to ensure long product life. Follow these instructions to reset your globe:

1. Unplug the unit from the wall, and then unplug the base.
2. Wait for 40 minutes.
3. Plug in the base first, and then plug into the wall.
4. After plugging the unit back in, wait thirty minutes before trying to levitate the globe. Make certain that the globe or other magnetic/iron items such as paperclips, staples, etc. are not near the base during this time.
